

# One Platform, Purpose Built for CMT & Geotechnical Firms

Omnant connects field data collection, lab testing, scheduling, and document control in one platform so your team spends less time chasing information and more time doing the work.

## Who We Are

Omnant Technologies builds construction materials testing software for CMT labs and Geotechnical engineering firms. Our platform connects field data collection, lab testing, scheduling, and document control in one system, purpose-built for the way your team actually works.

## Our Story

Founded in 2003, Omnant grew out of a fourth-generation, family-run testing lab's need to modernize. What started as an internal tool for tracking calibrations and replacing paper processes became a full platform refined through daily use in commercial testing environments for over two decades. We know this industry because we came from it.

## Problems We Solve

CMT and Geotechnical firms deal with the same pressure points every day: field data that doesn't connect to the lab, certifications and calibrations managed across spreadsheets, scheduling that breaks down when something unexpected happens, and documentation that's never quite where you need it when you need it. Omnant brings all of it into one place so your team spends less time chasing information and more time doing the work.

## Why CMT & Geotechnical Firms Choose Us

### Built for CMT & Geotech industry

Not adapted from generic project management software.

### Field-to-lab connected

Lab testing, field data, scheduling, and document control in one system.

### Certification-aware

Data flows from the field to the lab automatically, reducing handoffs and errors.

### All-in-one platform

Scheduling, field inspections, lab testing, and accreditations covered in one system.

### Up and running fast

Pull up any record, any schedule, any certification in seconds

### Scheduling built in

Technician assignments and equipment availability in one place.
