

Equipment Scheduling

Plan where every rig, crew, and instrument goes, not just when. Omnant connects equipment assignments, availability, and calibration status in one system, so your team stays coordinated, your equipment stays compliant, and the right equipment reaches the right site every time.

The Solution

A whiteboard or shared calendar can't keep up once more than a few people rely on it, and one rig sent to the wrong site costs a day nobody gets back.

Omnant's equipment scheduling software plans rig and crew assignments together, tracks check-in and check-out, and ties calibration and maintenance records to every instrument, so managers always know what's headed where.

Functionality

Rig & crew assignments

See which rigs and technicians are assigned to each project, with updates flowing through automatically when plans, PTO, or certs change.

Equipment check-in & check-out

Know what's available, checked out, or due back before you plan the next assignment, without calling around.

Calibration & maintenance tracking

Keep a complete maintenance history for every rig, gauge, and instrument, with alerts before anything falls out of service.

Benefits

Right equipment, right site

- Avoid sending the wrong rig, crew, or instrument to a job site, and the lost day, rescheduling, and client frustration that come with it.

Schedules that adapt

- Weather delays, PTO, and permit changes update assignments automatically, with no rebuilding by hand.

Multi-rig coordination

- Keep multiple rigs and crews coordinated across every project and location without juggling spreadsheets.

Audit-ready records

- Every calibration record is tied to the equipment and tests it supports, so proof is ready when an assessor asks.
